[Date]

Dear Hiring Team at **[Company Name]**,

I'm writing to apply for the **[Position]** role I found on JobStreet. Over the past five-plus years I've built and maintained backend services for systems that move money and handle sensitive data — currently at Paydia, a Bank Indonesia-licensed Payment Service Provider (PJP Category 1) for electronic money, fund transfer, and QRIS — and I'd like to bring that experience to **[Company Name]**.

Two things from my track record are worth highlighting. First, I led the migration of our payment acquirer from a PHP monolith to Go on a live production service, shipping it with a fallback path so the cutover happened with zero downtime. Second, I built fraud-prevention controls and disbursement/QRIS features integrated across multiple payment vendors, while closing 100% of internal penetration-test findings across three production systems. That combination — moving fast without losing sight of risk — is what I try to bring to every team I join.

I'm used to working in environments with high bars for reliability and security, from cross-agency government systems earlier in my career to real-time payment infrastructure today. I'd welcome the chance to talk through how this experience could support **[Company Name]**'s team, particularly for the **[Position]** role.

Thank you for your time and consideration — I'd be glad to speak further at your convenience.

Best regards,

Zul Anggara
