

Zul Anggara

Backend Developer — Fintech & Payment Systems

Jakarta, Indonesia • zul.anggara8@gmail.com • +62-813-3899-4643 • [linkedin.com/in/zulanggara](https://www.linkedin.com/in/zulanggara) • github.com/zulanggara

PROFESSIONAL SUMMARY

Backend developer focused on payment systems, currently at Paydia — a Bank Indonesia-licensed Payment Service Provider (PJP Category 1) for electronic money, fund transfer, and QRIS. Comfortable building and maintaining backend services for transaction processing, integrating with various vendors, and migrating legacy systems to newer technology. Works across PHP, Go, and Node.js with MySQL, Redis, and Elasticsearch on Kubernetes, with a background that spans payments, government systems, and university platforms.

TECHNICAL SKILLS

Languages: Go (Golang), PHP, JavaScript, TypeScript, SQL

Frameworks & Runtime: CodeIgniter 3, Laravel, Gin, Node.js, Yii2

Databases & Storage: MySQL (partitioning, indexing, query optimisation), Redis, PostgreSQL, Microsoft SQL Server, Elasticsearch

Infrastructure & Tools: Kubernetes, Docker, Git / GitLab, Kibana, SonarQube, Cron / Supervisor

Architecture: Microservices, scalable REST APIs, service migration, performance optimisation

Domain: Payment Systems, QRIS / MPM, acquirer & vendor integration, disbursement / payout, transaction reconciliation, fraud detection, API security

PROFESSIONAL EXPERIENCE

Backend Developer — PT Datacell Infomedia (Paydia)

Jul 2024 – Present

Bank Indonesia-licensed Payment Service Provider (PJP Category 1): electronic money, fund transfer, QRIS • Jakarta

Work on the core payment services across the merchant platform, mobile app, and admin dashboard — from migrating the payment acquirer from PHP to Go, to building features for transaction reconciliation, fraud prevention, and secure authentication.

- Led the migration of the payment acquirer from a PHP monolith to Go, delivering it with a fallback path to the existing system for a zero-downtime cutover on a live production service.
- Introduced daily table partitioning with automated backup and cleanup cron jobs for high-volume transaction and reconciliation data, keeping query performance stable as data grew.
- Closed 100% of internal penetration-test findings across three systems — the merchant platform, SNAP API, and mobile app — and hardened authentication in the process.
- Built fraud-prevention controls for merchant onboarding with multiple checkpoints: auto-block on threshold breach, plus blacklist checks on names, identifiers, and IPs at registration and login.
- Delivered disbursement and QRIS features end-to-end, integrating multiple payment vendors (payout inquiry, transfer, status), bulk payout, MPM decoding, and static-QR callback with signature handling and retries.

Backend / Laravel Developer — Phicos (Ideas for IT Solutions)

Feb 2021 – Jul 2024

Web application development for Indonesian government ministries · Surakarta

Backend / Laravel Developer · Full-time

Aug 2021 – Jul 2024

Built and maintained web systems for multiple Indonesian government ministries, including a learning-assistance platform, a national data-collection system spanning educational institutions across the country, and a performance-assessment tool. Developed backend services and APIs mainly with PHP (Laravel and CodeIgniter), handling most of the technical work end-to-end since the front-end needs were usually standard.

Backend / Laravel Developer · Contract

Mar 2021 – Aug 2021

Moved from internship to contract after a few months based on performance. Continued backend development while also managing the internal helpdesk and IT support.

Backend / Laravel Developer · Internship

Feb 2021 – Mar 2021

Helped build a fund-assistance system for a government ministry using PHP (Laravel) and MySQL. Learned Job/Queue in Laravel and how to run background processes with Supervisor.

Backend Developer (Intern) — PT Solusi Pembayaran Elektronik

Jul 2019 – Sep 2019

University internship · Yogyakarta

Worked with a small team to build an internal ERP system using PHP (Yii2) and MySQL, with Git for version control.

FEATURED PROJECTS

Fraud Detection System (private · Laravel, MySQL, Redis)

Internal system for detecting suspicious transaction patterns from large volumes of payment data, based on configurable parameters such as transaction spikes and abnormal amounts. Built as an admin panel for reviewing and managing flagged transactions.

Payment Biller Gateway (private · Go, PostgreSQL, Redis)

Broker service that connects a single upstream vendor to multiple client platforms, so each vendor integration is built once and reused across different apps and websites requesting top-up or billing services. Uses Redis for real-time notifications.

SIDAKIN & SIKERMA — Ministry of Education (Vocational) (PHP/Laravel, SQL Server, REST API)

National platforms that collect data from vocational higher-education institutions and process it into Key Performance Indicator (IKU) scores, plus management and publication of industry-collaboration data.

SIMONITA — PERURI (PHP/Laravel, SQL Server)

Real-time data monitoring and reporting system with scheduled jobs and RSync synchronisation.

Ngabei.id (PHP/Laravel & Lumen)

Web platform for plane/train ticketing and PPOB services, with a connector layer integrating third-party APIs.

SIMAHA & PKM System — Universitas Negeri Yogyakarta (PHP/Laravel, MySQL)

Campus platforms for student fund/letter requests and creativity-program (PKM) proposal management, review scoring, and reporting.

ORGANIZATIONS

IT Team — PKM Center UNY

Jun 2018 – Dec 2021

Universitas Negeri Yogyakarta

Volunteered in the student affairs division, building and maintaining internal systems for student program management and grant/proposal submissions, alongside supporting event logistics.

EDUCATION

Universitas Negeri Yogyakarta

Bachelor's in Informatics Engineering Education

2017 – 2023

Coursework focused on software engineering and web development. Started working as a developer from third year onward.

SMK Negeri 2 Surakarta

Software Engineering (RPL)

2014 – 2017
