

● Currently at Paydia – PJP Category 1

Hi, I'm Zul Anggara

Backend Developer

Fintech & Payment Systems

Building and maintaining backend services for transaction processing, vendor integration, and legacy-system migration – working across PHP, Go, and Node.js with MySQL, Redis, and Elasticsearch on Kubernetes.

// ABOUT ME

A backend developer focused on payment systems.

Backend developer focused on payment systems, currently at Paydia – a Bank Indonesia-licensed Payment Service Provider (PJP Category 1) for electronic money, fund transfer, and QRIS. Comfortable building and maintaining backend services for transaction processing, integrating with various vendors, and migrating legacy systems to newer technology. Works across PHP, Go, and Node.js with MySQL, Redis, and Elasticsearch on Kubernetes, with a background that spans payments, government systems, and university platforms.

Used to owning projects end-to-end – from leading a zero-downtime payment acquirer migration and closing 100% of internal penetration-test findings, to building fraud-prevention controls and disbursement/QRIS features integrated with multiple payment vendors.

// WORK EXPERIENCE

Professional journey

Jul 2024 – Present

Backend Developer

PT Datacell Infomedia (Paydia) · Jakarta

Bank Indonesia-licensed Payment Service Provider (PJP Category 1): electronic money, fund transfer, QRIS. Work on core payment services across the merchant platform, mobile app, and admin dashboard.

- Led the migration of the payment acquirer from a PHP monolith to Go, delivering it with a fallback path to the existing system for a zero-downtime cutover on a live production service.
- Introduced daily table partitioning with automated backup & cleanup cron jobs for high-volume transaction and reconciliation data, keeping query performance stable.
- Closed **100%** of internal penetration-test findings across three systems – the merchant platform, SNAP API, and mobile app – and hardened authentication in the process.
- Built fraud-prevention controls for merchant onboarding: auto-block on threshold breach, plus blacklist checks on names, identifiers, and IPs.
- Delivered disbursement & QRIS features end-to-end – vendor integration, bulk payout, MPM decoding, and static-QR callback with signature handling & retries.

Feb 2021 – Jul 2024

Backend / Laravel Developer

Phicos (Ideas for IT Solutions) · Surakarta

Web application development for Indonesian government ministries: a learning-assistance platform, a national data-collection system spanning educational institutions, and a performance-assessment tool. Most backend & API work built with PHP (Laravel and CodeIgniter).

- **Full-time** (Aug 2021 – Jul 2024) – built backend & APIs end-to-end for several ministry systems.
- **Contract** (Mar 2021 – Aug 2021) – moved from internship to contract after a few months based on performance; continued backend development while managing the internal helpdesk & IT support.
- **Internship** (Feb 2021 – Mar 2021) – helped build a fund-assistance system for a government ministry with PHP

(Laravel) & MySQL; learned Job/Queue and running background processes with Supervisor.

Jul 2019 – Sep 2019

Backend Developer (Intern)

PT Solusi Pembayaran Elektronik • Yogyakarta

Worked with a small team to build an internal ERP system using PHP (Yii2) and MySQL, with Git for version control.

// ORGANIZATIONS

Jun 2018 – Dec 2021

IT Team — PKM Center UNY

Universitas Negeri Yogyakarta

Volunteered in the student affairs division, building and maintaining internal systems for student program management and grant/proposal submissions, alongside supporting event logistics.

// SELECTED PROJECTS

Systems I've built

Fraud Detection System

Internal system for detecting suspicious transaction patterns from large volumes of payment data, based on configurable parameters such as transaction spikes and abnormal amounts. Built as an admin panel for reviewing and managing flagged transactions.

Laravel

MySQL

Redis

Payment Biller Gateway

Broker service that connects a single upstream vendor to multiple client platforms, so each vendor integration is built once and reused across different apps and websites requesting top-up or billing services. Uses Redis for real-time notifications.

[Go](#)[PostgreSQL](#)[Redis](#)

SIDAKIN & SIKERMA

MINISTRY OF EDUCATION (VOCATIONAL)

National platforms that collect data from vocational higher-education institutions across Indonesia and process it into Key Performance Indicator (IKU) scores, plus management and publication of industry-collaboration data.

[PHP / Laravel](#)[SQL Server](#)[REST API](#)

SIMONITA

PERURI

Real-time data monitoring and reporting system with scheduled jobs and RSync synchronisation.

[PHP / Laravel](#)[SQL Server](#)

Ngabei.id

TICKETING & PPOB PLATFORM

Web platform for plane/train ticketing and PPOB services (electricity, mobile credit top-ups, etc.), with a connector layer integrating third-

party APIs.

PHP / Laravel

Lumen

SIMAHA & PKM System

UNIVERSITAS NEGERI YOGYAKARTA

Campus platforms for student fund/letter requests and creativity-program (PKM) proposal management, review scoring, and reporting.

PHP / Laravel

MySQL

06
